

Minor Project-2 (Bharat Portal) Extension proposal

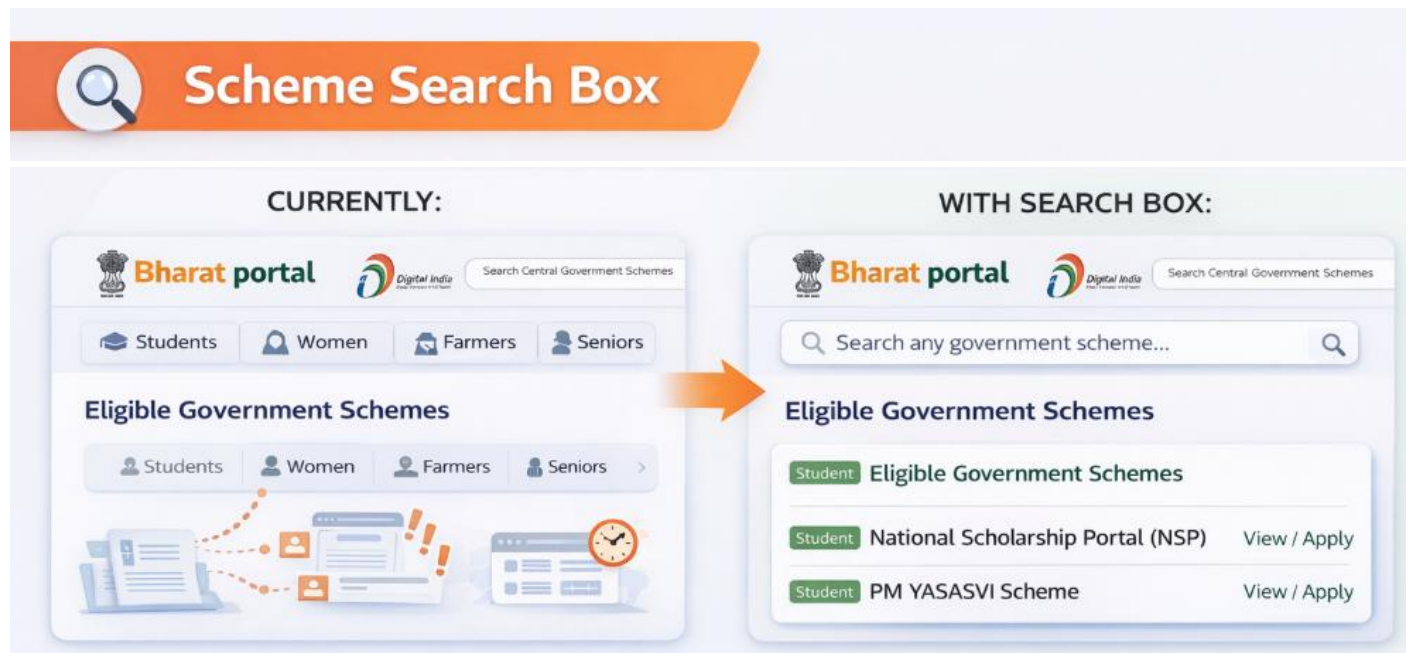

Name: ASHUTOSH KUMAR (20232749)

CHIRAG SHARMA (20232762)

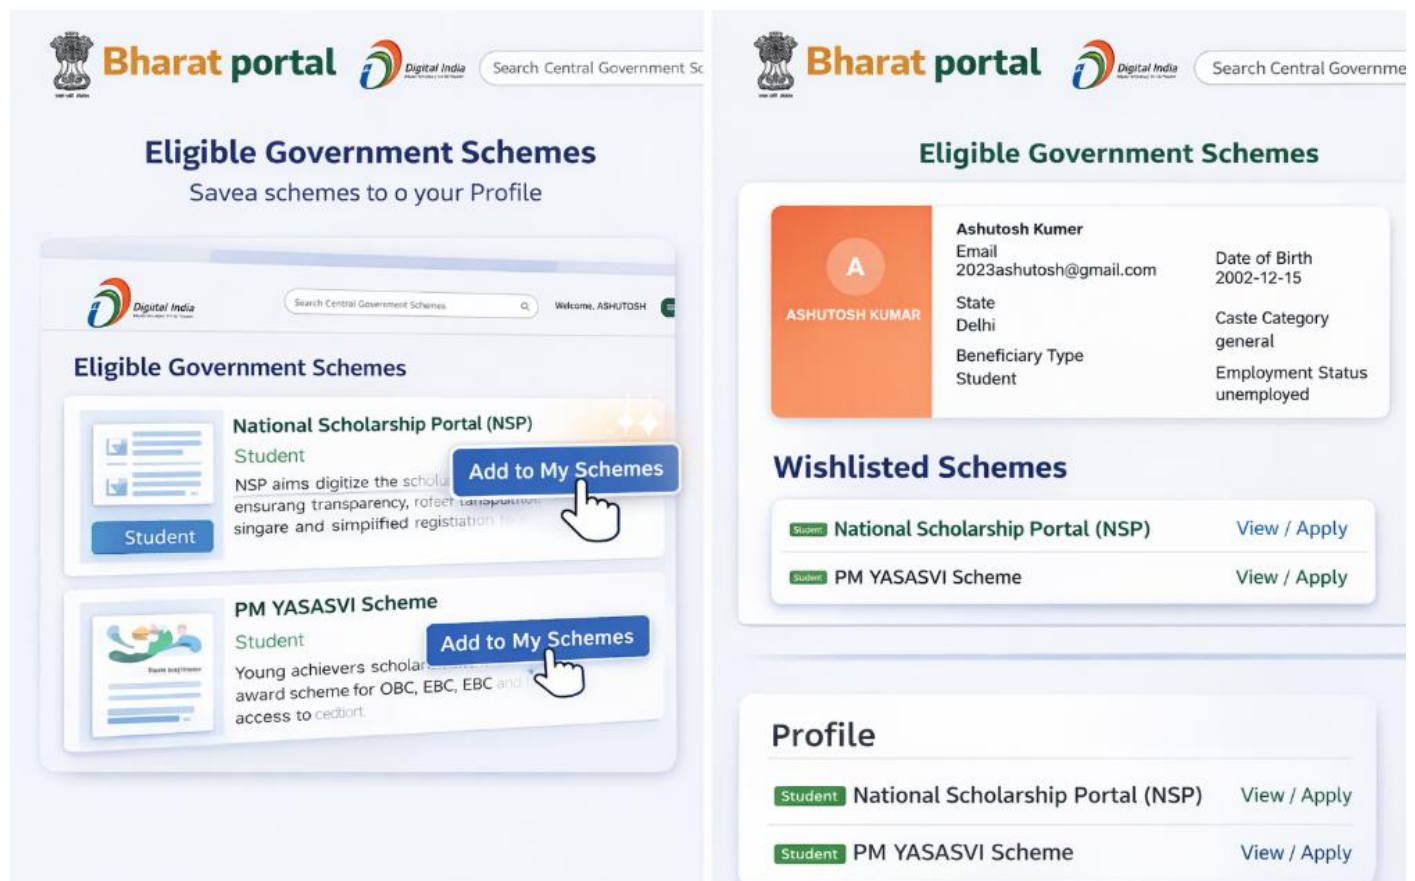

- Email Verification During Signup:** Currently, users can directly enter their details during signup, and their information is stored in the users.json file without any email verification. To ensure the authenticity of users, an email verification mechanism will be implemented using an Email API. After registration, a verification link or OTP will be sent to the user's registered email address, and the account will be activated only after successful verification.

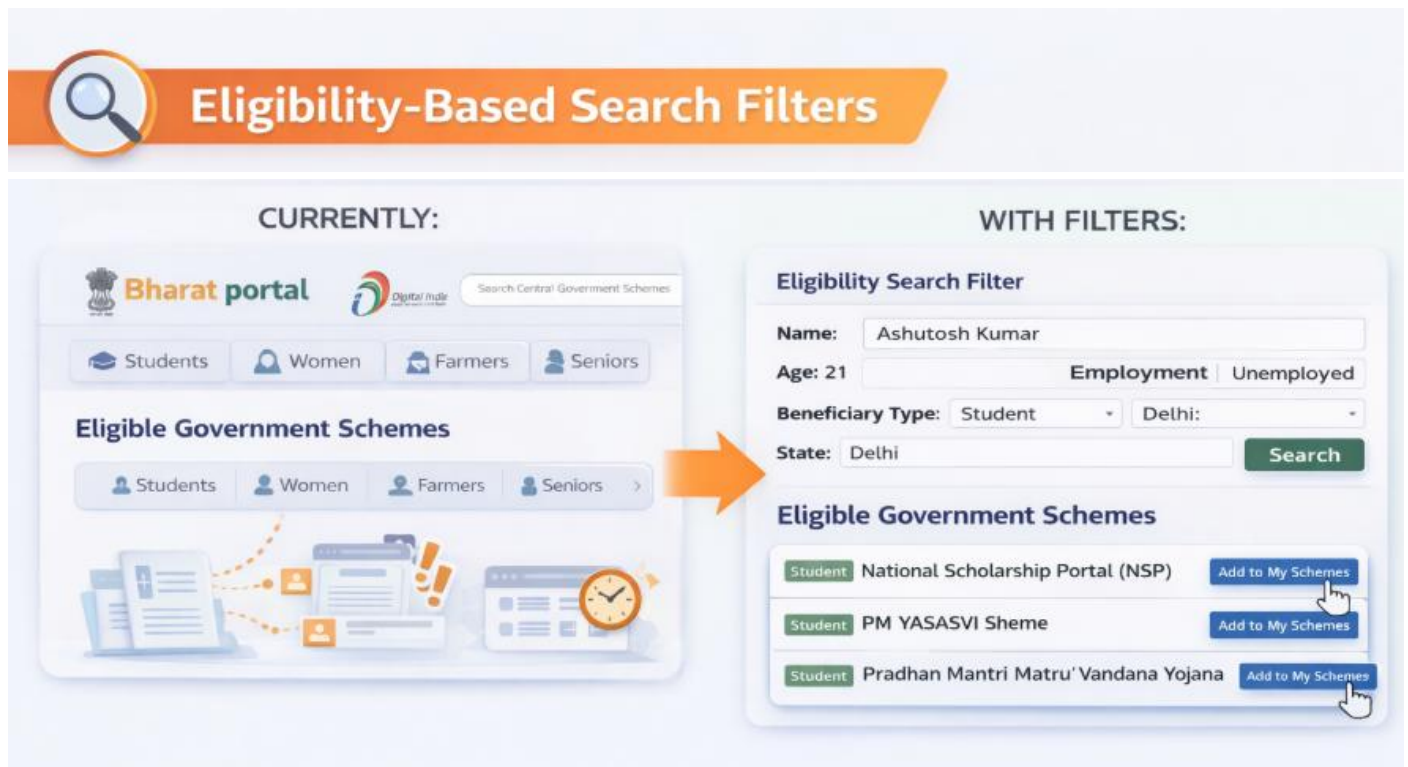

2.Scheme Search Box: At the top of the webpage, a search box is provided where users can search for any government scheme they want to know about. Currently, there is no such search box available. Users have to manually navigate through different categories to find and view government schemes, which makes the process time-consuming and less efficient.

3.User Profile:(Selected scheme list): After each scheme name, there will be an option to add the scheme to the user's profile. This allows users to save their preferred or eligible schemes for easy access later.

4.Search Filter: Currently, users have to manually choose their category and go through many schemes to check whether they are eligible or not. To overcome this problem, an eligibility-based search filter will be introduced. In this filter, users can enter details such as name, age, employment status, beneficiary type (farmer, entrepreneur, student, or senior citizen), caste category, and state. Based on these details, all the government schemes for which the user is eligible will be automatically listed.

Objectives of the Extension

- To improve usability and user experience
- To automate scheme eligibility identification
- To reduce manual effort in searching schemes
- To enhance security through email verification
- To provide personalized scheme recommendations

Tools and Technologies Used

- Frontend: HTML, CSS, JavaScript
- Backend: Node.js, Express.js
- Database: JSON / File-based storage/Mongo-DB
- Email Service: SMTP / Email API
- Development Tools: VS Code, Browser
